Staff Software Engineer | Developer Productivity & Dev Environments | Agentic Coding Platforms

Summary

Staff software engineer with 8 years building developer-productivity infrastructure used by hundreds of engineers: development environments, build systems, and continuous deployment. Architected an in-house autonomous coding-agent platform and its sandbox runtime, and now lead the rollout of cloud agentic-coding interfaces, including Claude, on a vendor-agnostic active-active model. I build with AI agents daily and have concrete views on inner-loop leverage: fast environments, strong isolation, and validation that catches failures before CI.

Technical Skills

Developer Environments & Build Systems

- Cloud dev environments, sandboxes, ephemeral/leased isolation, one-command startup, IDE launch
- **Bazel**, **Gradle**, hermetic builds, build caching, monorepo optimization, pre-CI validation

Containers & Cloud Infrastructure

- **Docker**, **Kubernetes** (pod-level ops), Terraform, BYOC container runtimes, multi-region
- AWS (EC2, ECR, SQS, Kinesis), **Argo Rollouts**, continuous deployment, Datadog

AI Agents & Agentic Coding

- Autonomous coding-agent platforms, agent orchestration, tool-permission isolation, MCP
- **Claude Code** and agentic coding (daily), vendor-agnostic model backends

Languages & Leadership

- **Python**, Kotlin, TypeScript, Groovy, SQL, C#
- Cross-team technical leadership, developer-productivity measurement, design docs

Experience

Developer Productivity, Dev Environments & Agentic Coding Platforms

Feb 2021 – Present

Staff Software Engineer & Senior Engineering Manager Faire

- Led the org-wide rollout of cloud development environments and built the developer CLI behind them: one-command startup, sandbox lifecycle, automatic work-in-progress backup, and direct IDE launch.
- Architected and own an in-house autonomous coding-agent platform (publicly cited as Samurai): a vendor-agnostic, type-safe sandbox model with leased, ephemeral environments for safe parallel execution.
- Leading the org-wide rollout of cloud agentic-coding interfaces, including Claude, on an active-active model that keeps multiple agent backends interchangeable and avoids lock-in to any single vendor.
- Built the agent-execution runtime from scratch in Python: a profile-based workflow engine, a layered tool-permission isolation model, pluggable model backends, and structured streaming output.
- Took an inherited deployment tool to general availability as the paved-path workflow for 98% of services, running on Kubernetes with pod-level rollout control and multi-region (EU/NA) fail-safes.
- Drove build-systems and inner-loop strategy across a large monorepo: a Kotlin 2.0 migration, a Bazel and hermetic-build evaluation, and the build-topology direction for hundreds of engineers.

CI & Build Performance

Feb 2018 – Dec 2020

Software Engineer Magnet Forensics

- Cut product build times by 66% through targeted CI optimization, build caching, and parallelization, shortening the edit-build-test inner loop and speeding release iteration for the engineering team.

Education

M.A.Sc., Electrical & Computer Engineering
University of Waterloo, Waterloo, ON

Jan 2016 – Feb 2018

B.Tech., Computer Science & Engineering
NIT Calicut, Kerala, India

Jul 2011 – May 2015
